

Overt and covert systems to track, monitor and protect people and property worldwide

GT9006

SOFTWARE

TRACK-IN-A-BOX SOFTWARE

## What is GT9006 Track-in-a-Box Software?

The GT9006 software provides a user or monitoring service provider the ability to implement their own web-based system for vehicle and asset tracking and personal security. It allows the user to implement simple but effective small-scale fleet or other asset tracking systems using simple-to-use, cost-effective 'out-of-the-box' software.

The location of each remote vehicle, boat, plane, or other asset is indicated on maps, satellite imagery or aerial photography as required. The software is available as pre-tested code which the user can integrate into his/her own internal or external website.

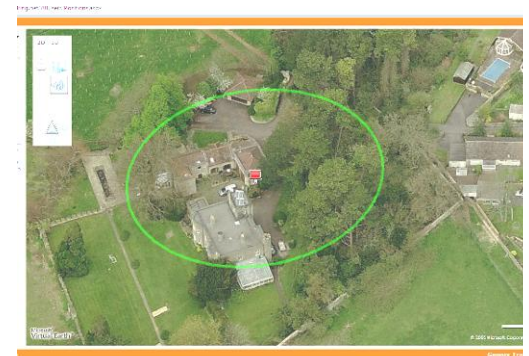

The software presents a simple graphical position of the person or asset. By hovering over the pushpin, the detail of the time, speed, location, direction and alert status are shown. The software is provided with interfacing into the mapping and imagery services of both Microsoft Windows Virtual Earth and Google Maps.

## What does it allow you to do?

- implement your own secure site for personnel, vehicle and other asset tracking
- be in control of your own user and password registration process
- provide your organisation with simple yet effective tools to monitor and protect people and property wherever they may be in the world
- can be customised by the user to provide a multitude of private applications dependent upon customer need

## Why 'buy' the GT9006 Track-in-a-Box Software for your tracking and mapping solution?

- practicality: allows users to monitor fleets in a secure and highly cost-effective manner
- flexible: works with all Geonix Tracking Cellular, Covert and Satellite devices
- uses globally available Virtual Earth and Google mapping and imagery
- support & advice for your tracking needs from a company that is an expert in both large and small solutions
- it's FREE

### Product Includes:

- code library
- note: consultancy available at additional cost

**No charge**

### Key Features:

- accepts data from compatible Cellular/Covert/Satellite units via GPRS and SMS
- simple, easy to use web tools 'out-of-the-box'
- works with freely available Windows Virtual Earth and Google Maps mapping data
- allows the user to be fully in control of their own security information produced both in map and aerial photograph form
- street data information is overlaid on satellite imagery
- views can be rotated, tilted and zoomed-in to show positions

### Requirements for end-to-end surveillance solution:

- compatible tracking device
- your own website
- SMS to internet communication service such as Hay Systems
- internet access from a PC using Internet Explorer, Mozilla Firefox
